JanGyan — Learn Without Limits

Category 4: Health & Emergency Awareness

Module 1 - Fundamentals of Health & Well-being

Module Overview

Health is the foundation on which every other part of life is built. Without good health, education, work, family life, and financial progress all become harder to sustain. This handbook is the first module of JanGyan's Health & Emergency Awareness category, and it introduces the basic building blocks of health that every citizen — students, working professionals, parents, and senior citizens — should understand.

By the end of this handbook, you will understand what health truly means, why it is much more than "not being sick," and how small daily habits protect you and your family for a lifetime. This module is designed as a complete, self-sufficient guide — you will not need to search any other website to understand the fundamentals of health and well-being.

Learning Objectives

After completing this module, you will be able to:

- Explain the true meaning of health beyond "absence of disease."
- Describe the three core dimensions of health — physical, mental, and social.
- Identify the most common health risks faced by Indian citizens today.
- Understand the difference between preventive, promotive, and curative healthcare.
- Build a personal set of daily healthy habits.
- Recognise the government's role in public health through key policies and schemes.
- Practise correct personal hygiene to prevent infections.
- Bust common health-related myths using facts.

Why This Topic Matters

> **Important**
> Health is not just a personal issue — it is a national asset. A healthy citizen learns better, earns better, and contributes more to family and society. A country full of healthy citizens builds a stronger economy and a more resilient nation.

In India, lifestyle-related illnesses are rising sharply. Non-communicable diseases (NCDs) such as heart disease, diabetes, cancer, and chronic respiratory illness now account for roughly **six out of every ten deaths** in the country — a dramatic shift from a few decades ago, when infectious diseases were the leading killers. Most of these NCDs are linked to habits we can actually control: diet, physical activity, tobacco and alcohol use, and stress management.

This makes health awareness one of the most important life skills a citizen can learn — more important than most people realise, because prevention is almost always cheaper, easier, and less painful than treatment.

Introduction

For centuries, "health" was understood simply as "not being sick." If a person had no fever, no injury, and no visible illness, they were considered healthy. This narrow view has changed completely.

In 1948, the World Health Organization (WHO) — the United Nations agency responsible for global public health — gave the world a much broader and more useful definition:

> **Definition**
> **Health** is "a state of complete physical, mental and social well-being, and not merely the absence of disease or infirmity."

This one sentence changed how doctors, governments, and citizens think about health forever. It tells us that a person can be physically disease-free but still unhealthy — for example, someone who is constantly stressed, lonely, or anxious. True health requires balance across the body, the mind, and one's relationships with society.

It also helps to think of health as a spectrum rather than a fixed label of "healthy" or "unhealthy." On any given day, a person sits somewhere between optimal well-being and serious illness, and small daily choices — what you eat, how you sleep, how you manage stress — quietly move you along that spectrum in one direction or the other.

Fundamental Concepts

1. What Is Health?

Health is a dynamic state of balance. It changes daily based on what we eat, how we sleep, how much we move, how we manage stress, and how we connect with people around us. It is not a fixed medal you earn once — it needs continuous care, like a plant that needs regular watering.

2. The Three Dimensions of Health

Dimension	What It Means	Simple Indian Example
Physical Health	The proper functioning of your body — organs, muscles, immunity, and energy levels.	A farmer who eats on time, sleeps 7–8 hours, and can work in the field without getting tired quickly.
Mental Health	Your emotional and psychological well-being — how you think, feel, cope with stress, and handle setbacks.	A student who feels calm and confident before exams because they manage stress well, not because they have no pressure at all.
Social Health	The quality of your relationships and your ability to interact positively with family, friends, and community.	A person who has supportive family ties and good relations with neighbours, and feels a sense of belonging.

> **Remember**
> All three dimensions are connected. Poor sleep (physical) can cause irritability (mental), which can strain relationships (social). Real health improvement usually means working on all three together.

3. Importance of a Healthy Lifestyle

- **Better productivity:** A healthy body and mind allow you to study, work, and earn more effectively.

- **Fewer medical expenses:** Prevention is far cheaper than treating advanced disease.
- **Longer, more active life:** Healthy habits reduce the risk of early disability and premature death.
- **Better family life:** A healthy person can care for children, elders, and dependents without becoming a burden themselves.
- **National development:** Healthy citizens strengthen the workforce and reduce pressure on public hospitals.

Complete Detailed Explanation

This section brings together everything a citizen needs to move from awareness to action — the risks to watch for, the preventive steps that work, the daily habits worth building, and the hygiene basics that protect an entire household.

4. Common Health Risks in India Today

Category	Examples	Main Causes
Lifestyle / Non-Communicable Diseases	Diabetes, high blood pressure, heart disease, obesity	Poor diet, low physical activity, tobacco, stress
Communicable / Infectious Diseases	Dengue, malaria, tuberculosis, diarrheal diseases	Poor sanitation, contaminated water, mosquito breeding, overcrowding
Mental Health Concerns	Anxiety, depression, chronic stress, burnout	Work pressure, academic pressure, social isolation, financial stress
Occupational & Environmental	Respiratory illness, injuries	Air pollution, poor workplace safety, unsafe practices
Nutritional	Anaemia, malnutrition, micronutrient deficiency	Unbalanced diet, poor access to nutritious food

Non-communicable diseases (NCDs) now form the largest share of this list. Unlike an infection, an NCD such as diabetes or hypertension usually builds up quietly over years through diet, inactivity, and stress, which is exactly why it is so easy to ignore until it becomes serious. The good news is that most NCD risk is modifiable — meaning your daily choices genuinely change your odds.

Communicable diseases such as dengue and diarrhoeal illness remain common in many parts of India, especially where sanitation and safe water are inconsistent. These are largely preventable through simple community-level hygiene and vector control rather than expensive treatment.

Mental health risk deserves equal attention. Rising academic, financial, and workplace pressure means stress-related concerns now affect people of every age group, not just adults — yet it remains one of the most under-discussed health risks in Indian households.

5. Preventive Healthcare

Preventive healthcare means taking action *before* illness occurs, rather than waiting to treat it afterward. It is the single most cost-effective strategy in all of medicine.

Type of Prevention	Goal	Example
Primary Prevention	Stop disease before it starts	Vaccination, handwashing, healthy diet, avoiding tobacco

Secondary Prevention	Catch disease early	Regular health check-ups, BP and sugar screening, cancer screening
Tertiary Prevention	Manage disease and prevent complications	Physiotherapy after illness, diabetes management, rehabilitation

> **Tip**
> A simple yearly health check-up (blood pressure, blood sugar, weight, and basic blood tests) can detect problems years before symptoms appear — especially for anyone above 30.

Choosing Prevention	Choosing to Wait
Lower long-term treatment cost	Higher cost once disease is advanced
Disease often caught at an early, manageable stage	Disease may only be noticed after complications appear
Fewer working days lost to illness	Longer recovery time and hospital stays
Better quality of life over the years	Greater physical and emotional burden on the family

6. Daily Healthy Habits

- **Balanced diet:** Include grains, pulses, vegetables, fruits, and adequate protein; reduce oil, sugar, and salt.
- **Regular physical activity:** At least 30 minutes of moderate activity (walking, yoga, cycling) on most days.
- **Adequate sleep:** 7–9 hours for adults; consistent sleep and wake times.
- **Hydration:** Enough clean drinking water through the day.
- **Avoiding tobacco and limiting alcohol:** Both are major contributors to NCDs and cancers.
- **Stress management:** Breathing exercises, meditation, hobbies, and social connection.
- **Regular hygiene practices:** Handwashing, bathing, oral care, and clean surroundings.

A Simple, Balanced Indian Thali

You don't need an imported diet plan to eat well — a traditional Indian thali, balanced correctly, already covers most nutritional needs:

Portion of the Plate	What to Include
About half	Vegetables and a portion of fruit
About a quarter	Whole grains — roti, brown rice, millets (jowar, bajra, ragi)
About a quarter	Protein — dal, beans, curd, egg, fish, or lean meat
Small portion	Healthy fats — a spoon of ghee or nuts

Mental Health & Stress Management

Mental well-being is built the same way physical fitness is — through small, regular practice. A few practical, evidence-informed habits help most people manage everyday stress:

- Talk about how you feel with someone you trust, instead of carrying it alone.
- Practise slow, deep breathing for a few minutes when overwhelmed.
- Protect your sleep — poor sleep and poor mental health feed each other.

- Limit continuous news and social media scrolling if it increases anxiety.
- Keep at least one activity purely for enjoyment, with no productivity goal attached.

> **Government Support**
> Tele-MANAS is the Government of India's free, 24x7 mental health helpline, offering counselling in over 20 languages. Anyone can call **14416** or **1-800-891-4416** — no referral needed, and it is completely confidential.

7. Public Health Awareness

Public health is about protecting the health of an entire community, not just one individual. It includes activities like vaccination drives, sanitation campaigns, disease surveillance, and health education. In India, the **National Health Mission (NHM)** and programmes like **Ayushman Bharat** and **Swachh Bharat Mission** work to strengthen public health at the community level.

8. Personal Hygiene Basics

Hygiene Area	Key Practice
Hand Hygiene	Wash hands with soap for at least 20 seconds before eating and after using the toilet.
Oral Hygiene	Brush teeth twice daily; floss and limit sugary snacks.
Body Hygiene	Daily bathing; clean, dry clothing.
Food Hygiene	Wash fruits and vegetables; cook food thoroughly; store food safely.
Environmental Hygiene	Keep surroundings free of stagnant water and garbage to prevent disease vectors like mosquitoes.

Important Terminologies

Term	Simple Meaning
Well-being	An overall positive state of being comfortable, healthy, and content in life.
Non-Communicable Disease (NCD)	A disease that is not spread from person to person, usually developing slowly due to lifestyle and genetic factors (e.g., diabetes, heart disease).
Communicable Disease	A disease that spreads from one person to another, or through vectors like mosquitoes or contaminated water.
Preventive Healthcare	Actions taken to prevent illness before it occurs.
Immunity	The body's natural ability to resist and fight infections.
Vector-borne disease	A disease transmitted by living organisms such as mosquitoes (e.g., dengue, malaria).
Public Health	The science and practice of protecting and improving the health of communities, not just individuals.

Step-by-Step Understanding

How a Foundation of Good Health Is Built

1. **Assess:** Understand your current habits — diet, sleep, activity, and stress levels.
2. **Set small goals:** Choose one or two habits to improve first (e.g., drink more water, sleep on time).
3. **Build routine:** Attach new habits to an existing routine, such as a morning walk before breakfast.
4. **Track progress:** Use a simple diary or app to note improvements.
5. **Get periodic check-ups:** Visit a doctor or a Health and Wellness Centre once a year, even without symptoms.
6. **Involve family:** Healthy habits are easier to sustain when the whole household participates.
7. **Review and adjust:** Revisit your goals every few months and add new healthy habits gradually.

Real-Life Indian Examples

Example 1

Rekha, a 45-year-old homemaker in Lucknow, started walking 30 minutes every morning with her neighbour. Within six months, her blood pressure readings improved, and she reported feeling less anxious and more socially connected.

Example 2

Arjun, a college student in Pune, used to skip breakfast and survive on packaged snacks during exam season. After learning about balanced nutrition, he switched to simple home-cooked meals and noticed better concentration and fewer headaches.

Example 3

A village in Odisha reduced dengue cases significantly after a community drive to remove stagnant water and use mosquito nets — a simple, low-cost public health intervention with a measurable impact.

Example 4

Suresh, an IT professional in Bengaluru working long desk hours, started experiencing back pain and poor sleep. Small changes — a standing break every hour, a fixed bedtime, and a short evening walk — resolved most of the discomfort within weeks, without any medication.

Practical Scenarios

Scenario	What You Should Do
You feel constantly tired despite sleeping 8 hours	Check for underlying causes: diet, screen time before bed, stress, or an undiagnosed condition; consult a doctor if it persists.
A family member has been diagnosed with high blood pressure	Support them with a low-salt diet, regular medication, and stress reduction; encourage regular monitoring.
Your child frequently falls sick with colds and stomach infections	Reinforce handwashing before meals, ensure boiled/filtered drinking water, and review food hygiene at home.
You feel persistently low, unmotivated, or anxious for weeks	Recognise this as a signal to seek support — talk to a trusted person and consider consulting a mental health professional.
An elderly parent keeps forgetting to take their daily medicine	Set up a pill organiser or phone reminder, and involve a family member in tracking doses.

Government Rules & Guidelines

The Government of India, through the **Ministry of Health and Family Welfare (MoHFW)**, runs several major public health initiatives:

Scheme / Mission	Purpose
National Health Mission (NHM)	Strengthens public healthcare infrastructure across rural and urban India.
Ayushman Bharat	Provides health insurance coverage and establishes Health and Wellness Centres for preventive and primary care.
Swachh Bharat Mission	Improves sanitation and hygiene to reduce disease caused by unclean environments.
Poshan Abhiyaan	Tackles malnutrition, especially among children, adolescent girls, and pregnant/lactating women.
Universal Immunisation Programme	Provides free vaccination against preventable childhood diseases.
Ayushman Bharat Digital Mission (ABDM)	Gives citizens a digital health ID (ABHA) to securely store and share health records across providers.
eSanjeevani	A national telemedicine platform enabling free online doctor consultations, especially useful in rural areas.
Tele-MANAS	A 24x7 toll-free mental health helpline (14416) offering counselling support across the country.

Laws & Policies

National Health Policy, 2017

India's National Health Policy 2017 is the guiding framework for the country's healthcare system. It emphasises preventive and promotive healthcare, aims to raise public health spending, and supports Universal Health Coverage so that citizens do not face financial hardship while accessing healthcare. It is implemented under the overall responsibility of the MoHFW and monitored through the National Health Mission.

Other relevant frameworks include the **Mental Healthcare Act, 2017**, which recognises the right of every citizen to access mental healthcare, and the **Food Safety and Standards Act, 2006**, which regulates the safety and hygiene of food sold to the public.

Important Statistics

Statistic	Insight
Non-communicable diseases account for roughly 60% or more of all deaths in India	Shows the scale of lifestyle-related illness compared to infectious disease.
Cardiovascular disease, cancer, respiratory illness, and diabetes are the leading NCD killers	These four conditions are strongly linked to diet, physical activity, and tobacco use.

Government has targeted raising public health expenditure toward 2.5% of GDP under NHP 2017	Reflects a national push to strengthen preventive and primary healthcare infrastructure.

Best Practices

- Eat home-cooked, balanced meals with visible portions of vegetables and pulses.
- Move your body daily — walking counts as exercise.
- Sleep and wake at consistent times, even on weekends.
- Get an annual health check-up after the age of 30.
- Wash hands before eating and after using the toilet, every single time.
- Keep vaccinations for children (and boosters for adults) up to date.
- Talk openly about mental health with family instead of hiding struggles.
- Read food labels and limit ultra-processed snacks where possible.
- Take short movement breaks during long hours of desk work or study.

Common Mistakes

- Ignoring symptoms and self-medicating for weeks without consulting a doctor.
- Treating exercise as optional rather than a daily requirement.
- Assuming mental health issues are "not real" or something to be ashamed of.
- Skipping meals or over-relying on packaged, processed food.
- Believing "I feel fine, so I don't need check-ups."
- Not washing hands before meals, especially outside the home.
- Comparing your health journey to someone else's instead of tracking your own progress.
- Stopping a prescribed medicine early just because symptoms have improved.

Myths vs Facts

Myth	Fact
"If I don't feel sick, I am completely healthy."	Health includes mental and social well-being too — you can feel physically fine and still be unhealthy overall.
"Only elderly people need to worry about blood pressure and diabetes."	Lifestyle diseases increasingly affect young adults due to poor diet, inactivity, and stress.
"Mental health problems mean a person is weak."	Mental health conditions are medical conditions, not a sign of weakness, and can affect anyone.
"Home remedies can replace all medical treatment."	Home remedies may help with minor discomfort, but serious or persistent symptoms need professional medical care.

"Exercise is only for people who want to lose weight."	Exercise benefits the heart, brain, mood, sleep, and immunity — regardless of body weight.
"Skipping meals is a quick way to lose weight."	It often backfires — leading to overeating later and disrupted metabolism.
"Only unwell people need health insurance."	Insurance protects everyone from sudden, high medical costs — it is a preventive financial habit too.

Do's and Don'ts

Do	Don't
Drink clean, safe drinking water	Don't drink from unknown or untreated water sources
Cover mouth and nose while coughing or sneezing	Don't ignore a persistent cough or fever for weeks
Keep surroundings clean and free of stagnant water	Don't allow water to collect in containers, coolers, or tyres
Consult a qualified doctor for health concerns	Don't rely only on unverified online advice or self-diagnosis
Encourage children to complete their vaccination schedule	Don't skip or delay recommended vaccine doses
Talk openly about stress or low mood with family	Don't dismiss a loved one's mental health concerns as "overreacting"

Safety Tips

Warning

Never ignore warning signs such as chest pain, severe breathlessness, sudden weakness on one side of the body, or high fever lasting more than 2–3 days. These require immediate medical attention.

- Keep a basic first-aid kit at home.
- Store medicines safely, away from children, and check expiry dates regularly.
- Keep emergency numbers (doctor, hospital, ambulance) saved and visible at home.
- Never share prescription medicines between family members without medical advice.
- Keep a written note of known allergies and existing conditions for family members, especially elders and children.
- Know the location and route to the nearest hospital or primary health centre before an emergency happens.

Emergency

In India, dial **112** for a unified emergency response (police, fire, medical), or **102 / 108** for ambulance services, depending on your state.

Practical Checklist

Daily Health Checklist

☐ Ate at least one full portion of vegetables/fruits today

☐ Drank sufficient water through the day

☐ Did at least 20–30 minutes of physical activity

☐ Slept 7–9 hours last night

☐ Washed hands before meals and after using the toilet

☐ Took a few minutes for mental relaxation (breathing, prayer, hobby, etc.)

☐ Avoided tobacco and limited alcohol intake

Quick Revision Notes

Revision

- Health = Physical + Mental + Social well-being (WHO, 1948).
- NCDs (lifestyle diseases) cause the majority of deaths in India today.
- Prevention has three levels: Primary, Secondary, Tertiary.
- Key schemes: NHM, Ayushman Bharat, Swachh Bharat Mission, Poshan Abhiyaan.
- Personal hygiene basics: hand, oral, body, food, and environmental hygiene.
- Emergency numbers: 112 (unified), 108/102 (ambulance).

Key Takeaways

Key Takeaway

1. Health is a complete state of physical, mental, and social well-being — not just the absence of illness.
2. Most major health risks in India today are preventable through daily habits.
3. Preventive healthcare and regular check-ups save both lives and money.
4. Personal hygiene is a simple but powerful tool against disease.
5. The government supports citizen health through national missions — but daily responsibility lies with each individual.

Glossary

Well-being — An overall positive state of being comfortable, healthy, and content in life.

NCD — Non-Communicable Disease; not spread person to person (e.g., diabetes, heart disease).

Communicable Disease — A disease that spreads between people or via vectors/contaminated water.

Preventive Healthcare — Actions taken to stop illness before it occurs.

Immunity — The body's natural ability to resist and fight infections.

Vector-borne Disease — A disease transmitted by organisms such as mosquitoes (e.g., dengue, malaria).

Public Health — Protecting and improving the health of entire communities, not just individuals.

Hygiene — Practices that keep the body and environment clean to prevent disease.

BMI (Body Mass Index) — A simple ratio of weight to height used as a rough screening indicator of healthy body weight.

Vaccination — Giving a vaccine to build immunity against a specific disease before exposure to it.

Sanitation — Safe management and disposal of human waste and wastewater to protect public health.

Frequently Asked Questions

1. What is the WHO definition of health?

A state of complete physical, mental, and social well-being, not merely the absence of disease or infirmity.

2. Is mental health as important as physical health?

Yes. WHO states there is "no health without mental health" — both dimensions are equally essential.

3. What are non-communicable diseases (NCDs)?

Diseases that are not spread person-to-person, such as diabetes, heart disease, and cancer, usually caused by lifestyle and genetic factors.

4. Why are NCDs increasing in India?

Due to changing lifestyles — less physical activity, more processed food, tobacco and alcohol use, and rising stress levels.

5. What is preventive healthcare?

Steps taken to stop illness before it happens, such as vaccination, hygiene, and healthy habits.

6. How much physical activity is recommended daily?

Generally around 30 minutes of moderate activity on most days of the week for adults.

7. How many hours of sleep do adults need?

Most adults need 7–9 hours of quality sleep each night.

8. What is the correct way to wash hands?

Wash with soap and water for at least 20 seconds, covering palms, between fingers, and under nails.

9. What is Ayushman Bharat?

A national scheme that provides health insurance coverage to vulnerable families and establishes Health and Wellness Centres for primary care.

10. What is the National Health Mission (NHM)?

A government mission that strengthens public healthcare infrastructure across rural and urban India.

11. What is the goal of Swachh Bharat Mission in health terms?

To improve sanitation and cleanliness, reducing diseases caused by poor hygiene and unsafe waste disposal.

12. Can a person be physically fit but still unhealthy?

Yes — if their mental or social well-being is poor, they are not considered fully healthy under the WHO definition.

13. What is the difference between primary, secondary, and tertiary prevention?

Primary prevents disease before it starts; secondary detects it early; tertiary manages it to avoid complications.

14. Why is an annual health check-up recommended after age 30?

Because many lifestyle diseases develop silently and are easier to treat when caught early.

15. What is a vector-borne disease?

A disease transmitted through living organisms such as mosquitoes, for example dengue and malaria.

16. How can I protect my family from vector-borne diseases at home?

Remove stagnant water, use mosquito nets or repellents, and keep surroundings clean.

17. What emergency numbers should every Indian citizen know?

112 for unified emergency response; 108 or 102 for ambulance services, depending on the state.

18. Is it normal to feel stressed sometimes?

Yes, occasional stress is normal, but persistent or overwhelming stress for weeks should not be ignored.

19. What does "public health" mean?

Protecting and improving the health of entire communities through awareness, sanitation, vaccination, and policy — not just individual treatment.

20. What is the single most important daily habit for good health?

There is no single habit — but a balanced diet, regular activity, adequate sleep, and good hygiene together form the foundation.

21. Where can citizens access free or subsidised preventive healthcare in India?

At government Health and Wellness Centres established under Ayushman Bharat, and through local NHM-supported health facilities.

22. What is ABHA (Ayushman Bharat Health Account)?

A digital health ID that lets citizens securely store and share their health records across hospitals and clinics.

23. What is Tele-MANAS, and who can use it?

A free, 24x7 government mental health helpline (14416) open to anyone in India, in over 20 languages — no referral required.

24. Is all "junk food" completely harmful?

Occasional consumption is generally fine — the concern is frequent, excessive intake replacing balanced meals over time.

25. What is eSanjeevani?

A national telemedicine service that lets citizens consult doctors online for free, widely used in rural and remote areas.

Conclusion

Health is not a destination — it is a daily practice. Every meal, every night's sleep, every walk, and every handwashing moment is a small deposit into your long-term well-being. The Government of India has built strong public health foundations through missions like Ayushman Bharat, NHM, and Swachh Bharat — but the first and most powerful line of defence is always the citizen themselves.

As you move ahead in the JanGyan platform, use the Practice and Quiz sections to reinforce what you've learned here, and don't hesitate to use AI Assistance whenever a doubt arises. A well-informed citizen is the strongest building block of a healthy nation.
